MSWhse May 2023 Enhancements

Outbound Transactions

Quantity Available reflects real time demands on the Item Number.

With this enhancement, Quantity Available is calculated to better reflect the true available quantity. The calculation is:

$$\text{Current Inventory on Hand} - (\text{Requested} + \text{New Processed}) = \text{Quantity Available}$$

Previously, an Item Number's **Quantity Available** was only updated after the completion of a transaction; therefore, the Quantity Available may not have been accurate.

This situation arose when two transactions were requesting the same Item Number. If the first transaction was not completed before the second transaction was entered, there was the possibility that there may not actually be enough quantity to cover the second transaction. This enhancement promotes peace of mind in knowing the quantity shown is the quantity available.

How do you know if inventory counts are reflecting a previously entered request for an item? When entering the quantity for an item, if the Item Number is also requested or is processing on a different transaction, this will appear **Warning: Quantity available shown is less other pending Outbound transaction**. If that warning is not there, there are no other transactions requesting the item number.

As an example, Item Number XYZ is showing a **Quantity Available** of 15 when entering a Requested Outbound on the first transaction.

The screenshot shows a web form for entering transaction data. The 'Quantity' section is at the top. Below it, 'Bill Type' is set to 'Pallet' and 'Bill Type Qty' is '1'. The 'Quantity Available' field shows '15' and is highlighted with an orange border. The 'Qty Requested' field is empty. At the bottom right, there are two buttons: 'Add Items from Grid' (blue) and '+ Add Item' (green).

The **Qty Requested** is 5 and then the **Quantity Available** changes to 10. The request is saved.

Quantity	
Bill Type	Bill Type Qty
Pallet	1
Quantity Available	Qty Requested *
10	5
<div>Add Items from Grid</div> <div>+ Add Item</div>	

Now, when a second transaction is entered as Requested Outbound (or a New Processing Outbound) and contains the same Item Number XYZ, the **Quantity Available** shows the real time availability of 10, even though the demand on the first order has not been pulled nor completed. Notice the warning that appeared stating the inventory reflects another transaction's demand.

Quantity	
Bill Type	Bill Type Qty
Pallet	1
Quantity Available	Qty Requested *
10	
<div>⚠ Warning: Quantity Available shown is less other pending Outbound transaction.</div>	
<div>Add Items from Grid</div> <div>+ Add Item</div>	

To continue to show real time data, when the **Qty Requested** is entered as 2, the **Quantity Available** shows 8.

Quantity	
Bill Type	Bill Type Qty
Pallet	1
Quantity Available	Qty Requested *
8	2
<div>⚠ Warning: Quantity Available shown is less other pending Outbound transaction.</div>	
<div>Add Items from Grid</div> <div>+ Add Item</div>

Anniversary Date Billing

MSWhse prorates Rates that change in the middle of a billing cycle.

Let's say an Anniversary Date Billing customers' Invoicing Date is the 15th of each month and a rate change goes into effect on the 1st. Before this update, an error would appear as MSWhse did not know which rate to use. Now, MSWhse will apply the first rate for the entire period and the new rate will start on the next invoice.

MSWhse May 2023 Fixes

Vaults

Vaults showing as unavailable are available.

This issue involved Vaults which had been previously in use and whose outbound transactions were completed. This has been resolved and vaults that are available show as available.

Billing & Payments

Storage Calculation for Anniversary, Weight by Transaction customers can be incorrect.

This fix impacts customers that are anniversary billed and have weight-by-transaction settings. The underlying issue was that an incorrect value could have been used for the monthly highwater mark because of a date sorting issue; however, this has now been corrected.

Administration: Imports

The Import Stock process was resulting in errors.

This Import process now works as intended. The culprit was a behind the scenes issue with Adding Locations and Location Types.
